

STEP 3 Analytic Explanation: from observed v outcomes to inferred growth regime

Synthetic low-growth case (true mean SGPC 39), baseline t-copula kernel (rho = 0.72, df = 8)

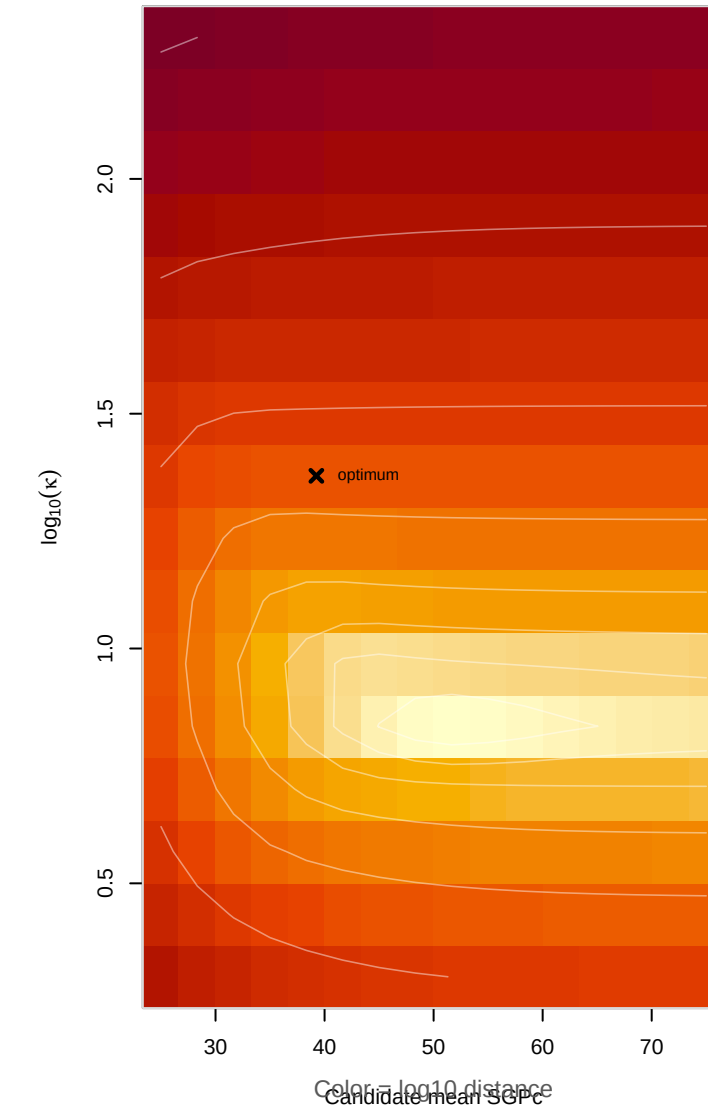

A. Observe unlinked U and V
No student-level pair IDs are used

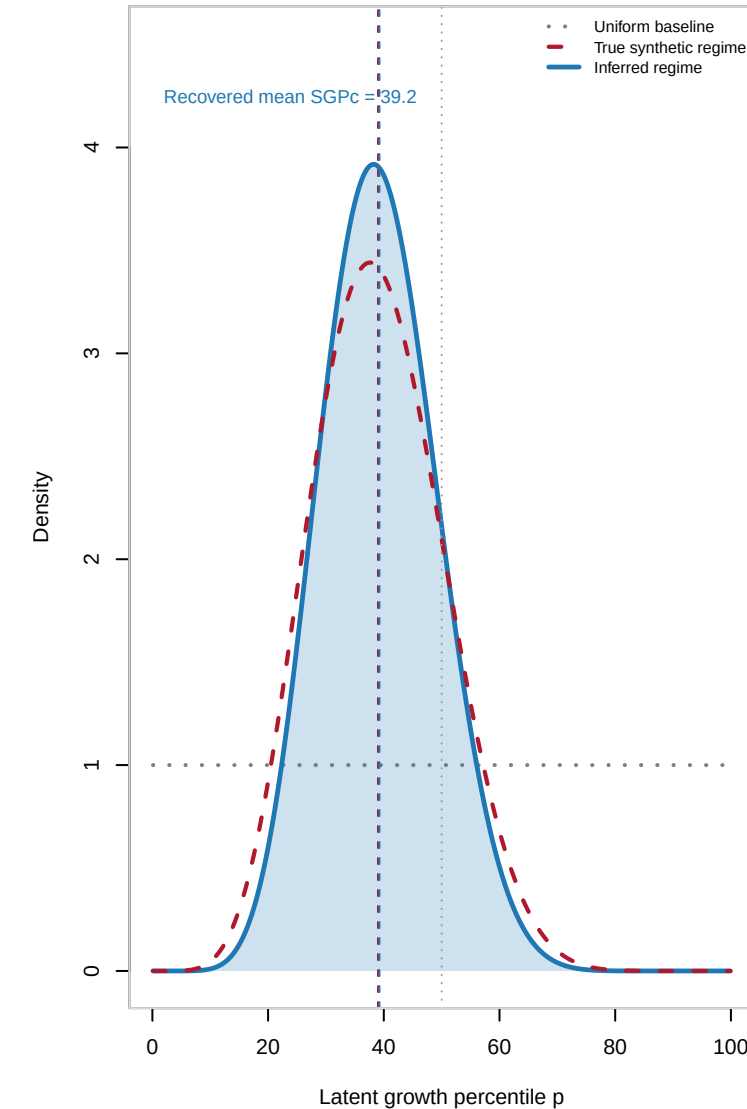

B. Forward check in v-space

C. Reverse-engineer theta

D. Inferred growth regime $H(\text{theta})$

Flow A -> B -> C -> D | W1 distance to observed CDF: uniform = 0.0915, inferred = 0.0030 (96.7% reduction)
