

From pseudo-observation scatter to copula: $H(x, y) = C(F_X^{\text{ref}}(x), F_Y^{\text{ref}}(y))$

Best fit: t -copula (df = 25.2, $\tau = 0.698$, $\rho_s = 0.890$, $\lambda = 0.227$) — ΔAIC vs. Gaussian = 210.7

CDF level curves $C(u, v) = c$ at $c = 0.1, 0.2, \dots, 0.9$ — Empirical Bernstein copula (dashed) vs. parametric t -copula (solid)
