

STEP 3 SGPcFlow analytic explanation: from observed V to inferred growth regime

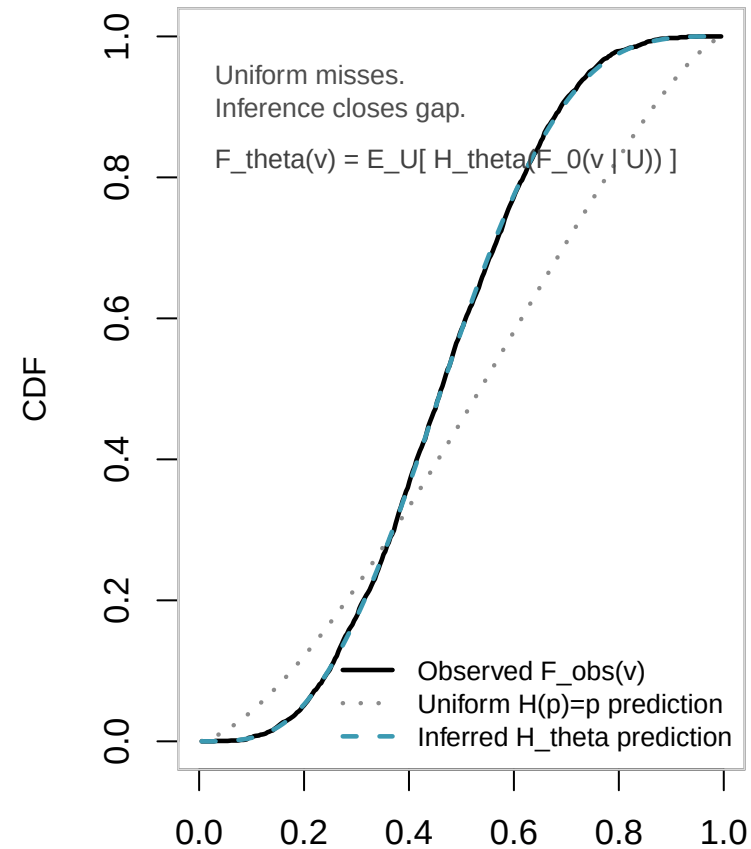

Synthetic low-growth case (true mean SGPc 39), baseline t-copula kernel (rho = 0.72, df = 8)

A. Independent U and V

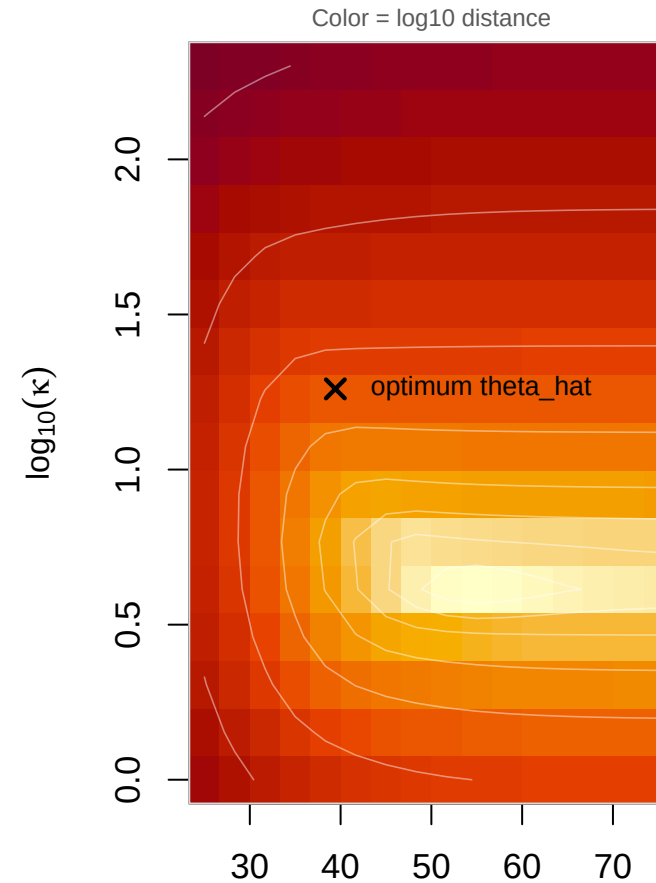

No student-level pair IDs are available

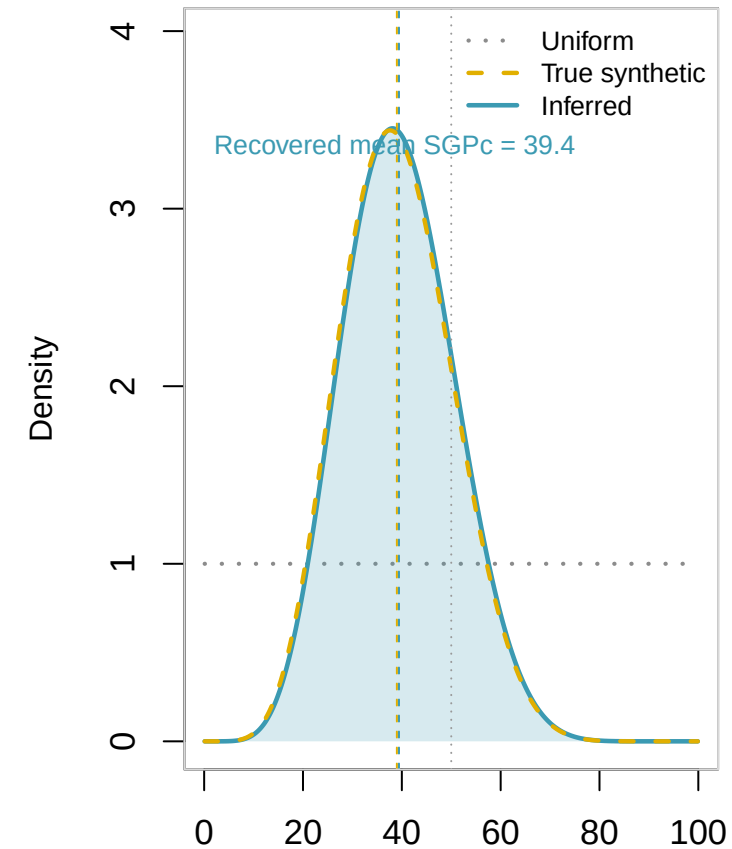

B. Forward check in v-space

C. Reverse-engineer theta

D. Inferred H_{theta}

Flow A -> B -> C -> D | $W1(F_{\text{obs}}, F_{\text{theta}})$: uniform = 0.0915, inferred = 0.0019 (97.9% reduction)
